

Press Release: UniPhi Rolls Out Their Biggest Update yet, with UniPhi 21

Australian software company UniPhi has released their newest version, UniPhi 21, with newer features to enhance overall workflow. UniPhi's most recent version provides users with a more efficient time in managing projects, streamlined navigation, and greater freedom in team collaboration.

With a smarter user interface implemented, UniPhi users can navigate their projects easier. A more consistent look, new sub-navigation and easier access to document generation.

The major functional enhancement was the harmonising of the various effort and money phasing screens. Collaborating with our global engineering clients, the goal was to guarantee that phasing of both effort and cash is more efficient and precise than ever before. The various ways of phasing effort and money across the platform had evolved over the 21 years of development, each with their own advantages and disadvantages. By taking the best bits of all and applying it everywhere, the users experience and capability has been increased dramatically.

UniPhi 21 will enable our global client base to leverage the distributed data capture concepts that have driven our development since day one. Now team leads, project managers and project controls can each input into the forecasting of effort and cash while senior managers can see the impact across the portfolio in real time. Transparency and auditability means that less experienced managers can still input the data but variances to budget and last forecasts can be instantly challenged and corrected as needed.
